

## C. Mike and gcd problem

time limit per test: 2 seconds

memory limit per test: 256 megabytes

input: standard input

output: standard output

Mike has a sequence  $A = [a_1, a_2, \dots, a_n]$  of length  $n$ . He considers the sequence  $B = [b_1, b_2, \dots, b_n]$  beautiful if the  $\gcd$  of all its elements is bigger than 1, i.e.  $\gcd(b_1, b_2, \dots, b_n) > 1$ .

Mike wants to change his sequence in order to make it beautiful. In one move he can choose an index  $i$  ( $1 \leq i < n$ ), delete numbers  $a_i, a_{i+1}$  and put numbers  $a_i - a_{i+1}, a_i + a_{i+1}$  in their place instead, in this order. He wants perform as few operations as possible. Find the minimal number of operations to make sequence  $A$  beautiful if it's possible, or tell him that it is impossible to do so.

$\gcd(b_1, b_2, \dots, b_n)$  is the biggest non-negative number  $d$  such that  $d$  divides  $b_i$  for every  $i$  ( $1 \leq i \leq n$ ).

### Input

The first line contains a single integer  $n$  ( $2 \leq n \leq 100\,000$ ) — length of sequence  $A$ .

The second line contains  $n$  space-separated integers  $a_1, a_2, \dots, a_n$  ( $1 \leq a_i \leq 10^9$ ) — elements of sequence  $A$ .

### Output

Output on the first line "YES" (without quotes) if it is possible to make sequence  $A$  beautiful by performing operations described above, and "NO" (without quotes) otherwise.

If the answer was "YES", output the minimal number of moves needed to make sequence  $A$  beautiful.

### Examples

<b>input</b>
2 1 1
<b>output</b>
YES 1
<b>input</b>
3 6 2 4
<b>output</b>
YES 0
<b>input</b>
2 1 3
<b>output</b>
YES 1

### Note

In the first example you can simply make one move to obtain sequence  $[0, 2]$  with  $\gcd(0, 2) = 2$ .

In the second example the  $\gcd$  of the sequence is already greater than 1.
